Appendix k: Classroom Observation Sheet (for main study)

Structured Classroom Observation Sheet for the Pilot Study

Study Title: The Effect of the Integrated Correction Model on EFL Learners' Essay-Writing Performance

Observation Type: Pilot Classroom Observation Summary

Inspector: Abdelghani FARAH

Participants: Six second-year secondary-school students

Duration: Two weeks / six sessions

Instructional Focus: Implementation of the Integrated Correction Model (ICM)

Pilot Observation Summary

Table 1: Structured Classroom Observation Sheet for the Pilot Study

No.	Feature Observed	Observation / Degree of Occurrence	Comment
1	Students understood the writing prompts.	Yes	Both the pre-test and post-test prompts were clear to all students.
2	Students engaged with coded feedback symbols.	Partially	Some students showed confusion about certain feedback codes and required reference to the code list.
3	Peer collaboration occurred.	Partially	Students discussed corrections, but some groups needed guidance, and a few dominant speakers appeared.
4	The teacher facilitated the task without giving direct answers.	Partially	The teacher occasionally provided direct correction when students were frustrated.
5	Students produced revised drafts.	Partially	Revision was attempted, but not all groups completed a revised final draft.
6	Feedback loops were completed.	No	Revision and reflection stages were not fully completed within the available time.
7	Time management during phases was effective.	No	The decoding phase took longer than planned, and the revision phase was shortened.
8	Students engaged with feedback.	Moderate	Students were interested, but they were still learning the procedures of the correction model.
9	Use of metalinguistic terminology.	Limited	Only a few students used terms such as "verb," "tense," and "spelling."
10	Overall feasibility of the ICM in classroom practice.	Promising	The pilot showed that the classroom procedures were workable, but more time, modelling, and training were needed before the main study implementation.

General Inspector's Comment

The pilot observation indicated that the Integrated Correction Model was generally feasible for classroom use. Students were able to understand the writing prompts and showed initial engagement with coded feedback and peer discussion. However, the observation also revealed that some students needed more support in decoding feedback symbols, using metalinguistic terminology, and completing the full feedback loop within the allocated time. The pilot therefore suggested the need for clearer modelling, more explicit explanation of feedback codes, and better time allocation before the main study.
