Inspector's Classroom Observation Sheet

Observation Date: _____

Inspector: Mohamed SAIDI **Specialty:** English Inspector (30 Years of experience)

School: Chiekh Larbi Tebessi secondary-school, Tebessa.

Observed Group: ■ Experimental (ICM) ☐ Control (Traditional)

Observed Week: ■ W1 ☐ W2 ☐ W3 ☐ W4 ☐ W5 ☐ W6

Session(s): ■ 1 ■ 2 ■ 3

Instruction: Complete the Section A table that matches the observed group. The other Section A table may be left blank.

A. Instructional Format and Feedback Cycle

A1. Experimental Group (ICM)

S.	Observed Feature	Y.	P.	N.	Evidence / Notes
1	Teacher introduces the prompt and activates prior knowledge or task understanding.	■	☐	☐	Teacher spent 10 minutes explaining the prompt, defining key terms, and activating prior knowledge
1	Students work in small collaborative groups (e.g., 4–5 learners) with visible role-sharing or coordinated drafting.	■	☐	☐	Groups of 4-5 students formed. Role-sharing was informal; no designated roles assigned yet.
1	Groups produce one collaborative draft for submission.	■	☐	☐	Each group produced a single collaborative draft after 45 minutes of discussion and joint writing.
1	Teacher collects drafts and applies coded feedback symbols only, without direct written correction.	■	☐	☐	Teacher collected drafts and applied coded symbols (T, S-V, Prep ...etc) after class. No direct corrections were written.
2	Teacher returns drafts with coded symbols and students begin decoding them.	■	☐	☐	Drafts returned with coded symbols. Approximately one-third of students struggled with symbol recall initially.
2	Students discuss the codes and negotiate corrections within groups or with peers.	■	☐	☐	Students discussed error types within groups. Some hesitation observed. Some groups had dominant speakers while quieter students observed passively.
2	Peer exchange across groups occurs and the teacher facilitates without supplying direct answers.	☐	■	☐	Limited peer exchange between groups occured. Teacher occasionally provided direct answers when pressed by frustrated students rather than prompting peer discussion
3	Groups revise and complete a final draft that incorporates coded and peer feedback.	☐	■	☐	Revision was attempted, but not all groups completed a polished final draft within the session. Students relied heavily on teacher confirmation.
3	Final presentation, summary feedback, and individual reflection closes the cycle.	☐	☐	■	No presentations, summary feedback, or reflection activity occured in week 1. The cycle closed with revision only.

Note: S.: Session, Y.: Yes, P.: Partly, N.: No

A. Instructional Format and Feedback Cycle (continued)

A2. Control Group (Traditional Correction)

S.	Observed Feature	Y.	P.	N.	Evidence / Notes
1	Teacher introduces the writing prompt or task without collaborative modelling.	☐	☐	☐	
1	Students draft individually and work mostly in silence.	☐	☐	☐	
1	Drafts are collected at the end of the session.	☐	☐	☐	
2	Students continue the same essay individually; no pair or group discussion is required.	☐	☐	☐	
2	Teacher circulates mainly to answer individual questions rather than facilitate peer learning.	☐	☐	☐	
2	Teacher collects completed drafts for home correction or later return.	☐	☐	☐	
3	Corrected essays are returned with underlining and direct written correction.	☐	☐	☐	
3	Students review corrections individually, with limited questioning.	☐	☐	☐	
3	A model text or teacher-provided correct version is supplied and copied.	☐	☐	☐	

Note: S.: Session, Y.: Yes, P.: Partly, N.: No

B. Student Engagement and Interaction

Indicator	V. L.	L.	M.	H.	V. H.	Notes
Attention during teacher explanation or task briefing	☐	☐	☐	■	☐	students listened attentively. Teacher explained coded symbols. many students asked clarifying questions.
Engagement with received feedback or corrections	☐	☐	☐	☐	■	students engaged actively with coded symbols. they used reference cards to decode errors.
Quality of peer or pair interaction (when relevant)	☐	☐	■	☐	☐	Groups discussed error types. Some hesitation, but some students participated actively.
Willingness to ask questions about errors or revisions	☐	☐	☐	■	☐	Several students asked Teacher about symbol meanings. Some asked peers first.
Use of metalanguage (e.g., tense, agreement, article, punctuation)	☐	■	☐	☐	☐	Limited use. A few students attempted to name error types (e.g., "spelling", "tense").
Student-initiated correction or revision	☐	■	☐	☐	☐	Students began revising but relied on Teacher confirmation.
Overall participation and on-task behaviour	☐	☐	☐	■	☐	Most groups on Task. Some off-Task talk in 3 groups.

Note: V.L.: Very Low, L.: Low, M.: Moderate, H.: Height, V.H.: Very Height.

Estimated percentage of actively engaged students: 55 – 60 %

Inspector's Note:

First week of ICM implementation. Students enthusiastic but still learning coding system. Some confusion with symbols. Teacher facilitates well but occasionally provides direct answers. Promising start.

C. Classroom Dynamics and Teacher Practices

Observation Category	Notes
Clarity of instructions and task guidance	Instructions for collaborative drafting were clear. Coded symbols explained with examples.
Responsiveness to students' questions	Teacher responded promptly. Occasionally provided direct answers instead of prompting peer discussion.
Type and quality of feedback provided	Coded symbols only. No direct corrections. Feedback was accurate.
Classroom organization, seating, and noise level	Students arranged in groups of 4 – 5. Noise level productive but occasionally high.
Time management across phases or sessions	Poor time management. Decoding and revision Took longer than planned
Use of board, model text, coding system, or visual aids	Coding symbol poster displayed. Laminated reference cards provided to each group.
Evidence of student autonomy and self-correction	Limited. Students sought Teacher confirmation frequently.
Encouragement of discussion, revision, or reflection	Teacher encouraged group discussion. No reflection activity in weeks.

D. Comparative Lens (Optional)

Dimension	Experimental Group (ICM)	Control Group (Traditional)
Nature of feedback provided	Coded symbols only	Red underlines + direct corrections written above / beside errors.
Teacher role during correction	Facilitator, coder	Corrector, model provider.
Student role during the lesson	Active decoder, collaborator	Passive receiver, copier
Peer interaction and collaboration	Frequent (group discussions, some peer exchange	None
Student engagement with feedback	55-60% actively decoding and discussing	15-20% glanced at corrections for 2 minutes.
Revision requirement	Yes (revision attempted, though not fully completed)	No (only copied model text from board)
Use of metalanguage	Emerging (few students used "Tense", "spelling"... etc)	None
Observable learning behaviours	Decoding, discussing, attempting revision.	Copying, glancing, waiting
Student autonomy	Emerging (students began revising but relied on Teacher)	None (students expected Teacher to fix all errors)
Evidence of progress or improvement	Baseline week	Baseline week

Comparative Note:

Week 1 serves as baseline for both groups. the experimental group shows emerging signs of active engagement (55-60%) and frequent peer interaction, though still adapting to coded symbols. the control group remains passive (15-20% engagement) with no peer interaction. the experimental group's challenges (symbol confusion, time management) are productive struggles; the control group's passivity offers no struggle and no growth. the divergence in student roles is already visible.

E. Challenges or Constraints Observed

Challenge	Y.	N.	Description / Evidence
Confusion with feedback symbols, instructions, or task expectations	■	□	Approximately one-third of students struggled to recall symbol meanings. Frequent reference to cards.
Limited engagement with feedback or corrections	□	■	Most students engaged actively with coded feedback.
Uneven participation among students or groups	■	□	Some groups had dominant speakers; quieter students observed passively.
Over-reliance on teacher confirmation or direct answers	■	□	Students frequently asked Teacher "Is this correct?" before consulting peers.
Weak or absent peer interaction where collaboration was possible	□	■	Most groups interacted frequently. 3 groups had limited discussion.
Mechanical copying or superficial completion without understanding	□	■	Students decoded rather than copied. Understanding was evident.
Difficulty moving between phases, tasks, or transitions	■	□	Transition from decoding to peer discussion was disjointed. Students unsure when to begin.
Off-task behaviour, distraction, or loss of focus	□	■	Minimal off-task behaviour.
No visible revision or limited transfer of feedback to later writing	□	■	Revision was attempted (not completed)
Other (specify):_____	□	□	None observed

Note: Y.: Yes, N.: No

F. Overall Impression and Summary Comments

Strengths observed during the session:

1. Students responded positively to collaborative drafting.
2. Coded feedback system was introduced clearly.
3. Teacher demonstrated good facilitation skills.
4. Most groups produced a collaborative draft.

Weaknesses / concerns observed:

1. Symbol confusion slowed down decoding phase.
2. Uneven participation within some groups.
3. Time management needs improvement
4. Teacher occasionally provided direct answers instead of prompting.

General summary comment: weeks of JCM implementation shows promise. Students are adapting to collaborative work and coded feedback. Frequent peer interaction is emerging, though not yet extensive. Initial challenges are typical for a new pedagogical approach. With continued practice, these issues are likely to resolve.

Recommendations for Subsequent Sessions

1. Provide additional practice with symbol decoding before peer exchange.
2. Assign specific group roles to ensure equitable participation.
3. Encourage students to consult peers before approaching the teacher.
4. Reduce the number of coded symbols in early sessions.
5. Introduce structured peer exchange across groups.

Final Summary Comment from the Inspector: The JCM has been introduced successfully. Students are engaged and willing to collaborate. Frequent peer interaction is already observable, though still developing. The coded feedback system is a significant shift from traditional correction, and students will need time to internalize it. The teacher should resist providing direct answers and instead prompt peer discussion.
